

From Data to Action: The Agentic AI Revolution

Saudi Arabia is one of the most important emerging markets for AI, Agentic AI, data, cloud, and automation in the Middle East. The Kingdom's Vision 2030 agenda continues to drive investment in digital transformation, smart government, non-oil economic diversification, and advanced technology adoption. SDAIA's national data and AI strategy is directly linked to Vision 2030 and aims to position Saudi Arabia as a leader in data and artificial intelligence.

The market is moving from basic digital transformation to advanced enterprise intelligence, where Agentic AI is expected to play a major role in enabling smarter, faster, and more autonomous business operations. Organizations are no longer only asking how to digitize processes; they are asking how to use AI, Agentic AI, data, cloud, and automation to improve decision-making, operational efficiency, customer experience, productivity, and business resilience.

AI infrastructure is also becoming a major national priority. Reuters reported significant AI-related infrastructure activity involving Humain, including financing for AI data center capacity and partnerships connected to advanced computing infrastructure. This supports the broader shift toward enterprise AI adoption, Agentic AI readiness, cloud modernization, and data-driven business models.

Independent market estimates also point to strong growth in Saudi Arabia's AI sector. Grand View Research estimated Saudi Arabia's AI market at around USD 9.26 billion in 2025, with projected growth to about USD 102.8 billion by 2033. While forecasts vary by source and methodology, the direction is clear: Saudi Arabia is becoming a high-growth market for enterprise AI, Agentic AI, data platforms, cloud infrastructure, automation, and intelligent business applications.

For 2027, this creates a timely opportunity for the Autonomous Enterprise Conference – Riyadh to address the most important question facing enterprise leaders:

Are organizations truly ready to move from AI experimentation and Agentic AI pilots to autonomous, production-grade enterprise execution?

3. Why Attend?

Understand the Future of Agentic AI in the Enterprise

Agentic AI is becoming one of the most important conversations in enterprise technology. Unlike traditional automation, Agentic AI has the potential to plan, reason, take actions, interact with systems, and support complex business workflows with limited human intervention. This conference will help leaders understand where Agentic AI is practical today, where it is still risky, and how to build a responsible roadmap for adoption.

Move from AI Pilots to Production

Many enterprises are running AI experiments, chatbots, analytics pilots, and automation projects. The bigger challenge is scaling these initiatives into secure, governed, production-grade systems. The conference will focus on how organizations can overcome barriers around data quality, cloud readiness, integration, governance, compliance, cybersecurity, and business adoption.

Build a Data-Ready Enterprise

Agentic AI cannot succeed without trusted, accessible, governed, and well-structured data. Discussions will focus on data governance, data platforms, data quality, data engineering, real-time analytics, data privacy, and how enterprises can prepare their data foundations for AI-driven operations.

Explore Cloud, Automation, and AI Infrastructure

Saudi Arabia is seeing major momentum in AI infrastructure, cloud, and data center investments. Reuters reported that Saudi AI company Humain secured up to **\$1.2 billion** in financing to expand digital and AI infrastructure, including plans linked to AI data center capacity. This creates a strong market context for enterprise leaders to rethink cloud modernization, AI infrastructure, and scalable digital operations.

Network with Senior Enterprise and Government Leaders

The forum is designed for high-level discussions, practical case studies, leadership networking, and strategic technology conversations across government, banking, energy, telecom, aviation, healthcare, manufacturing, logistics, real estate, and large enterprises.

Key Discussion Topics

- **Agentic AI in Action: From Pilots to Production** — Exploring how enterprises can move beyond AI experiments and scale Agentic AI into real business operations.

- Enterprise Data Readiness, Governance, Security and Trust — Discussing whether organizations have the right data foundation and governance to support Agentic AI at scale.
- Building the Autonomous Enterprise with AI, Data, Cloud and Automation — Understanding how these technologies work together to create smarter, faster, and more connected enterprises.
- From Automation to Autonomy: Transforming Business Operations — Examining how Agentic AI is helping businesses move from rule-based automation to intelligent autonomous operations.
- Cloud Modernization, Cybersecurity and Enterprise AI Infrastructure — Highlighting the role of cloud, secure platforms, and modern infrastructure in supporting scalable AI adoption.
- AI Agents in Enterprise Applications, Industry Use Cases and ROI — Exploring how AI agents can improve ERP, CRM, IT service management, low-code platforms, and deliver measurable business value.
